

Machine Learning of Many Body Localization

Philipp Krüger
(Dated: July 14, 2020)

Exact diagonalization was used to find the reduced density matrices of the lowest energy eigenstate of the Heisenberg Model with an additional field in z-direction at low and high disorder strength. The resulting dataset representing extended and localized phases, was used to train a neural network to deduct the critical disorder strength for a phase transition.

I. INTRODUCTION

Review Literature on task

Why is the topic interesting? = Finding W_c ?

A. Hamiltonian of the Heisenberg model

What is it used for? With $J = 1$, $h_i \in [-W, W]$

$$H = J \underbrace{\sum_i \vec{S}_i \cdot \vec{S}_{i+1}}_{\text{Exchange Energy}} - \underbrace{\sum_i h_i S_i^z}_{\text{Random Field}} \quad (1)$$

Outcome expectation:

In the ergodic phase (delocalized phase) $h < h_c$, the many-body eigenstates are thermal,^{20–23} so the isolated quantum system can relax to thermal equilibrium under the dynamics due to its Hamiltonian. In the thermodynamic limit $L \rightarrow \infty$, the system thus successfully serves as its own heat bath in the ergodic phase. In a thermal eigenstate, the reduced density operator of a finite subsystem converges to the equilibrium thermal distribution for $L \rightarrow \infty$. Thus the entanglement entropy between a finite subsystem and the remainder of the system is, for $L \rightarrow \infty$, the thermal equilibrium entropy of the subsystem. At nonzero temperature, this entanglement entropy is extensive, proportional to the number of degrees of freedom in the subsystem.

In the many-body localized phase $h > h_c$, on the other hand, the many-body eigenstates are not thermal:² the “eigenstate-thermalization hypothesis”^{20–23} is false in the localized phase. Thus in the localized phase, the isolated quantum system does not relax to thermal equilibrium under the dynamics of its Hamiltonian. The infinite system fails to be a heat bath that can equilibrate itself. It is a “glass” whose local configurations at all times are set by the initial conditions. Here the eigenstates do not have extensive entanglement, making them accessible to density-matrix renormalization-group-type numerical techniques.⁵ A limit of the localized phase that is simple is $J = 0$ with $h > 0$. Here the spins do not interact, all that happens dynamically is local Larmor precession of the spins about their local random fields. No transport of energy or spin happens and the many-body eigenstates are simply product states with each spin either “up” or “down.” <https://doi.org/10.1103/PhysRevB.82.174411>

non-thermalising phase, in which the system violates the Eigenstate Thermalisation hypothesis <https://arxiv.org/pdf/1610.03042.pdf>

Jlg: (large W) localized phase (adiabatically connected to trivial state), Jlg extended phase (small W) (ordered??)

Is scaling important?

B. Exact Diagonalization

Introduce concepts: Exact Diagonalization,

C. Areal (reduced??) Density Matrix

areal Density Matrix: http://www.thphys.nuim.ie/staff/jvala/Lecture_9.pdf

Reduced density operator

Suppose we have physical systems A and B, whose state is described by a density matrix ρ^{AB} . The reduced density operator for system A is

$$\rho^A = \text{tr}_B(\rho^{AB})$$

where tr_B is an operator map known as partial trace over system B. It is defined as

$$\rho^A = \text{tr}_B(|a_1\rangle\langle a_2| \otimes |b_1\rangle\langle b_2|) = |a_1\rangle\langle a_2| \text{tr}(|b_1\rangle\langle b_2|)$$

where $|a_1\rangle$ and $|a_2\rangle$ are any two vectors in A and $|b_1\rangle$ and $|b_2\rangle$ are any two vectors in B. $\text{tr}(|b_1\rangle\langle b_2|)$ is the usual trace, so $\text{tr}(|b_1\rangle\langle b_2|) = \langle b_2|b_1\rangle$ (via completeness relation!)

Physical interpretation:

The reduced density matrix ρ^A above provides correct measurement statistics for measurements on system A.

FIG. 1: Example of a figure [7].

vs

direct density matrix: (DOI: 10.1103/PhysRevB.99.054208 says Instead of dividing the system into two subsystems A and B to calculate the reduced density matrix of an eigenstate ρ and using the entanglement spectrum as the training data set ^{34,35}, we directly feed the probability density of the eigenstate ψ computed in the spin basis to the machines as the training data set. The reason for doing so is that, although by preprocessing the training data can reduce the dimension and filter out redundant information, useful information contained in the wavefunction of the entire system can also be lost.)

Conclusion: = areal

D. Neural Networks and Convolutional Neural Networks

Neural Network, CNN

II. MATERIALS AND METHODS

A. Code Protocol

Explain Flow with figure

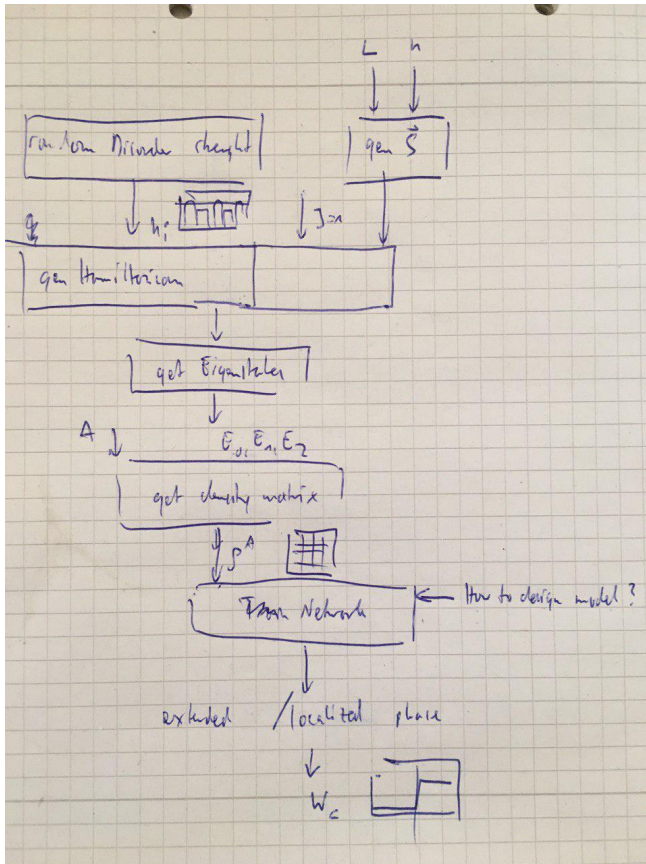

FIG. 2: Example of a figure [7].

Fig. 2

III. RESULTS

A. Generation of density matrix training set

Chosen parameters: $L \in \{10, 11, 12\}$. Repetitions: 100. Measure of variation in the test set??

B. Machine Learning Models and Error Metrics

Loss: SparseCategoricalCrossentropy from <https://keras.io/api/losses/>

Optimizer: Adam

Explain metrics and errors and why they are used.
Which ml models are used and why?

Hyperparameters? Amount of layers?

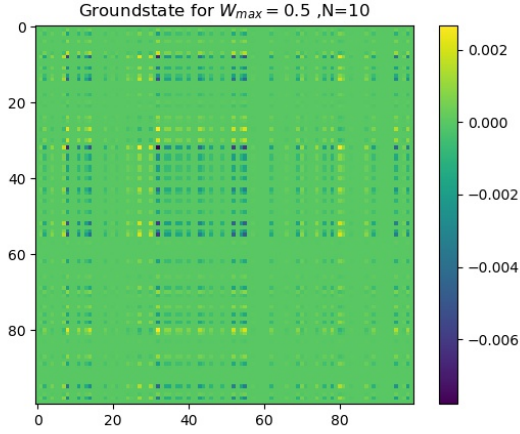

FIG. 3: Real part of the density matrix of an ergodic phase $N = 10$.

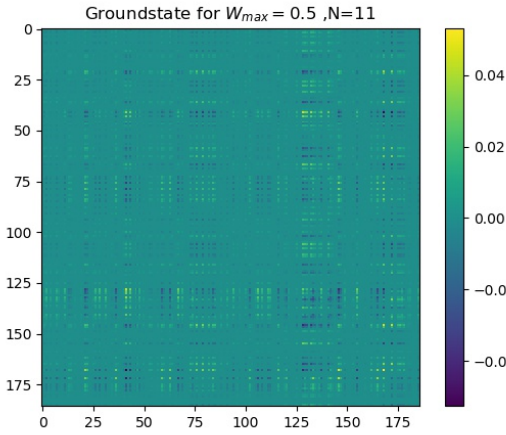

FIG. 4: Real part of the density matrix of an ergodic phase $N = 11$.

Plots: What is computationally realizable in 1h concerning time? The training set was sufficiently large enough

We only need M Eigenstates

This is how corresponding density matrices look like

This will be our parameter space for n, L

B. Prediction of extended vs localized phase

Training and validation scores:

C. W_c analysis

Now we generate testing set with $W_{max} \in [0, 4]$. We suspect W_c to be at 1 ?? We fit a logistic curve and extract

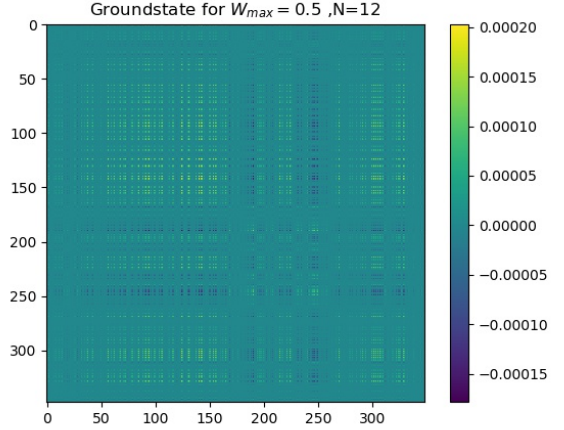

FIG. 5: Real part of the density matrix of an ergodic phase $N = 12$.

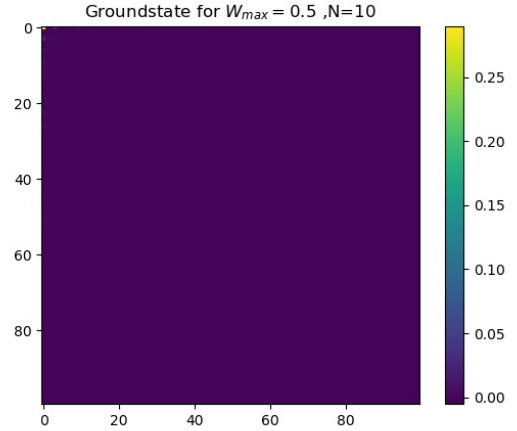

FIG. 6: Real part of the density matrix of a localized phase $N = 10$.

W_c as a parameter.

These are our W_c depending on n, L .

IV. CONCLUSION

W_c depends on n, L (yes/no).

W_c prediction coincides with the expectation (yes/no)

W_c is dependent on these and that effects = scaling analysis? (yes/no)

Citations are numerical[1], some more citations [2–6].
